

Increase microbial diversity,  
soil organic carbon, and crop  
yields.

Reduce fertiliser use.

Regenerate your farm.

## BEAM Inoculant

Biologically Enhanced  
Agricultural Management

Reduce fertiliser use,  
potentially by up to 80%.

## BEAM Inoculant is a 100% organic, fungal-dominant, compost extract...

Produced using the principles of static pile aerated compost (developed by Dr David Johnson in the Johnson-Su bioreactor), BEAM is ideal for interrow cultivation, pasture and orchard improvement.

Designed to increase soil biology, this direct ground spray is suitable for a wide range of crops including:

- cover crops
- pasture
- passionfruit
- macadamias
- bananas
- avocados
- and other horticultural crops.

BEAM is also suitable for tank mixing with nitrogen-fixing and/or mycorrhizal inocula.

**Better for your soil and better for the environment.**

## Banyula Rural

### FIELD CROPS

BEAM benefits include improvements in soil organic carbon levels and microbial diversity, increased crop yields, and mitigation of fertiliser usage by a notable margin.

BEAM has also been proven effective in regenerating soil, particularly when applied directly over the seed row of cover crops at planting. Combine with ReGenic for added efficacy.

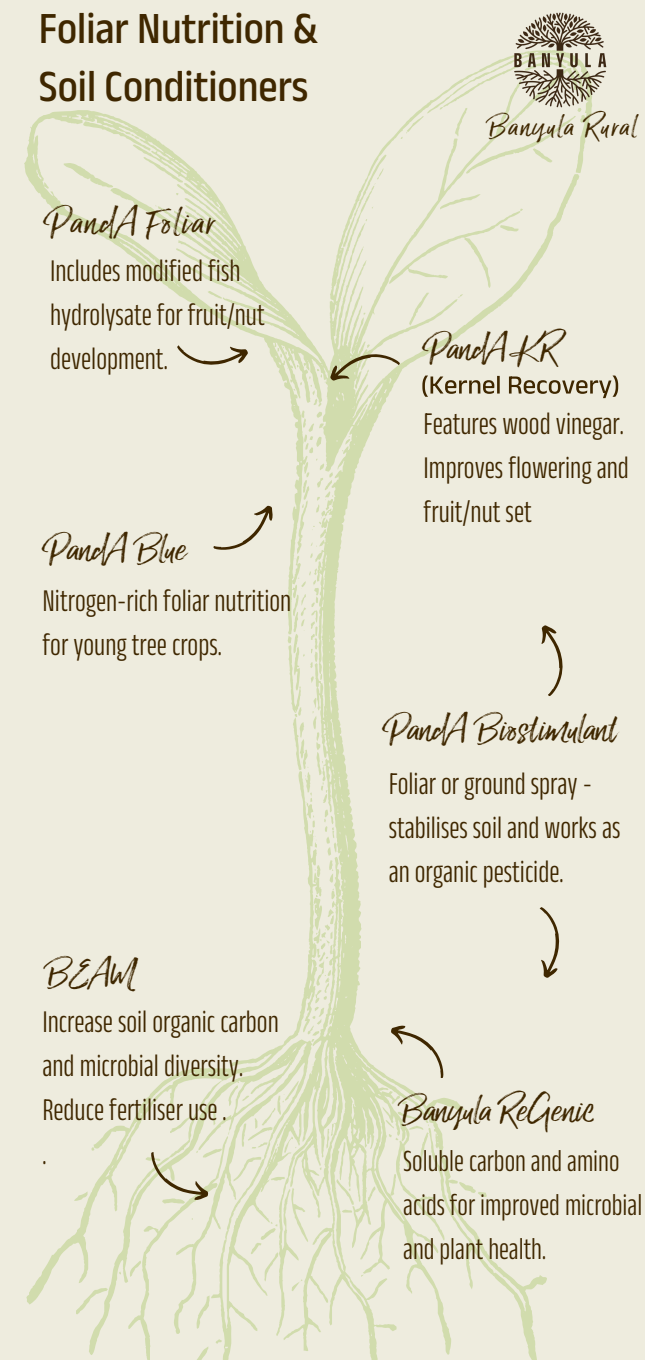

BEAM is available as 5L, 10L and 1000L concentrate and has a pH of between 4.5 and 6.5.

The recommended application rate for passionfruit, macadamia, banana, and avocados is 2-4 litres per hectare, ideally with 15-20 litres of Banyula ReGenic in 2000 litres of water.

### NURSERY & HOME GARDENS

Simply mix BEAM with soil or water to give your plants the nutrient boost they need to thrive. Mix 1 part inoculant to 50 parts water, to boost plant vigour and establishment. For optimal results, combine BEAM with Banyula ReGenic (1 part BEAM into 5 parts ReGenic and 50 parts water, 1:5:50).
